Copy the enclosed *defaultworkspaces.html* and *defaultWorkspaceService.js* into *src/services/defaultWorkspaces/*

You will also need to ensure that defaultWorkspaceService.js is added to your build. Our default build system in the seed project ensures that service files are built automatically (without need a specific entry point to be identified). See /build/webpack/webpack.services.js for details.

Then insert the following definition into *configs/application/services.json*:

```
{
    "comment": "Houses config for any custom services that you'd like to
import into Finsemble.",
    "services": {
        "defaultworkspacesService": {
            "useWindow": true,
            "active": true,
            "name": "defaultworkspacesService",
            "file": "defaultworkspaces/defaultworkspacesService.js",
            "visible": false,
            "html": "/services/defaultworkspaces/defaultworkspaces.html"
        }
    }
}
```

Add workspaces to *config/application/workspaceTemplates.json or otherwise ensure they are imported*

N.B. Workspaces can be created by exporting from Finsemble. Exporting will result in a file that contains:

```
"workspaceTemplates": {
    "workspaceName": {
        ....
    }
}
```

In *workspaceTemplates.json*, you can insert multiple workspaces:

```json
"workspaceTemplates": {
    "workspaceName1": {
        ....
    }
    "workspaceName2": {
        ....
    }
}
```
